PROFILE

Full-Stack Software Engineer with hands-on experience building responsive, data-driven web interfaces and backend services (React, Next.js, Django, REST APIs). Comfortable turning complex data into clear, functional dashboards and UI components, with a strong attention to detail and accuracy. Experienced working independently and asynchronously with distributed teams, and trained in access governance and data security practices (RBAC, eJPT certified) — attentive to confidentiality when handling sensitive information.

TECHNICAL SKILLS

Frontend: HTML, CSS, JavaScript, TypeScript, React, Next.js — responsive components across devices
Backend: Python, Django, NestJS (Node.js), REST API design, PostgreSQL
Tools & Workflow: Git/GitLab, Docker, Kubernetes, CI/CD (GitOps/Argo CD), Ansible, Linux/Unix
Security & Access: RBAC design, security auditing/hardening, eJPT (Junior Penetration Tester) certified
Other: LangChain / RAG for chatbot integration, clean code & documentation practices

EXPERIENCE

Full-Stack Developer — *Internship*

Dec 2024 – Jun 2025 | Benguerir, Morocco

- Built a business-process digitalization platform end-to-end: backend logic, REST API, and PostgreSQL data layer.
- Developed and refined UI workflows for non-technical, decision-making end users, replacing manual email-based processes with an automated, structured system.
- Implemented role-based access control (RBAC) and worked with the IT team to audit and harden web service security — ensuring sensitive data stayed properly restricted.
- Integrated a GenAI chatbot to speed up data entry and guide users, improving day-to-day operational accuracy.
- Built backend services and interfaces around REST/JSON APIs with an emphasis on clean, well-documented, maintainable code.

TECHNICAL PROJECTS

Cloud-1 — *Automated Cloud Infrastructure*

Ansible / AWS

- Automated a full cloud deployment with Ansible: one-command, reproducible, version-controlled provisioning (AWS), with SSH restrictions and automated TLS/HTTPS encryption.
- Managed environment lifecycle via Makefile to control cloud costs; persisted data through mounted volumes for resilience across restarts.

Inception of Things — *Kubernetes Orchestration*

K3s / GitOps

- Set up a multi-node K3s cluster (Vagrant, SSH-key auth) with a GitOps CI/CD pipeline (Argo CD) auto-syncing GitHub changes to the cluster.

EDUCATION

1337 Coding School (42 Network)

Nov 2021 – Present

Advanced engineering projects in low-level programming (C/C++) and modern web technologies, in a peer-driven, self-directed, project-based curriculum.

Physics Studies

2016 – 2018

Baccalauréat — Physical Sciences

2016

CERTIFICATIONS

eJPT — eLearnSecurity Junior Penetration Tester (06/2025): Network & system auditing, penetration testing, enumeration, exploitation, pivoting, web application security.
