

AMINE EL BEKARI

Full-Stack Developer | TypeScript, React & Next.js

amineelbekari8@gmail.com | +212 6 25 63 04 82 | [linkedin.com/in/amine-el-bekari](https://www.linkedin.com/in/amine-el-bekari) | github.com/Amine-Elbekari | [Portfolio](#)

PROFILE

Full-stack developer working across the whole TypeScript stack, from React and Next.js interfaces to Node.js backend services and relational databases. Shipped a business platform end to end during an internship, including a GenAI chatbot feature that went straight into daily use. Comfortable owning a feature from idea to production, working autonomously, and moving fast. Generalist by nature, at ease on frontend, backend, or infrastructure, and used to working async with distributed teams.

EXPERIENCE

Full-Stack Developer — Internship

Dec 2024 – Jun 2025

Benguerir, Morocco

- Owned a business-process digitalization platform end to end in TypeScript, with a NestJS backend, REST API, and PostgreSQL data layer, and a Next.js frontend, shipping it for daily use by internal clients.
- Replaced a slow, manual email-based workflow with an automated system, iterating directly with the people who used it.
- Designed and shipped a GenAI chatbot feature to speed up data entry and guide users, from idea to production use.
- Implemented role-based access control (RBAC) and worked with IT to audit and harden web service security.

TECHNICAL SKILLS

- Frontend: TypeScript, JavaScript, React, Next.js, Tailwind CSS, HTML/CSS
- Backend: Node.js (NestJS), Python (Django, FastAPI), REST API design, JSON, Serverless (AWS Lambda)
- Databases: SQL (PostgreSQL) — schema design, relationships, indexing, TypeORM
- AI & Automation: LangChain, RAG, GenAI chatbot integration into production tools
- DevOps & Infra: Docker, Kubernetes, CI/CD (GitOps/Argo CD), Ansible, Nginx, Redis, Git/GitLab, Linux/Unix
- Security & Access: RBAC design, security auditing, eJPT (Junior Penetration Tester) certified

TECHNICAL PROJECTS

ft_rental_architecture — Distributed Booking Platform

FastAPI / PostgreSQL / Redis / Docker

- Designed a microservices booking engine built to prevent double-booking under high concurrency, with Nginx, FastAPI, PostgreSQL, and Redis fully containerized via Docker Compose.
- Solved race conditions with Redis expiring checkout locks and PostgreSQL row-level locks for atomic, ACID-compliant transactions, validated by a 50-concurrent-request test suite.
- Modeled availability with native PostgreSQL daterange types and a composite GiST index for instant overlap queries at scale.
- Locked down the network so only Nginx is publicly exposed, and handled Stripe webhooks server-side with signature verification and idempotency.

Cloud-1 — Automated Cloud Infrastructure

Ansible / AWS / Docker

- Automated a full WordPress stack deployment on AWS EC2 with Ansible, from provisioning to teardown, behind SSH-restricted security groups and auto-generated TLS certificates.
- Managed the full infrastructure lifecycle via Makefile, with host-mounted volumes for data persistence across reboots.

Darkly — Web Security Audit

OWASP / Manual Penetration Testing

- Manually identified and exploited 14 web vulnerabilities (SQL injection, XSS, LFI, session hijacking) as part of a two-person team, without automated tools like sqlmap.
- Documented each finding against OWASP Top 10 categories with proof of concept and remediation recommendations.

EDUCATION

1337 Coding School (42 Network)

Nov 2021 – Present

- Self-directed, project-based curriculum with no lectures — built and shipped engineering projects independently and in small teams, from low-level C/C++ to modern web stacks.

Physics Studies, Baccalauréat — Physical Sciences

2016 – 2018

CERTIFICATIONS

- eJPT — eLearnSecurity Junior Penetration Tester (06/2025): network and system auditing, penetration testing, web application security. Credential: [verify](#)
